Producing members of specific binding pairs - by expression in recombinant host cells with a secreting replicable genetic display package.

```
a single chain Fv library from an immunised mouse. The library produces a clive VH sequence is one of antibody fragments specific for 2-phenyl-5-caiverse repertoire of antibody from minned from mRNA from mice immunised with phox coupled to chicked serum albumin. The VH and VL kappa sequences were sequenced sequences were sequenced revealing the phage surface as fusions with gene III. The resulting library of clones was diverse. Twenty three hapten binding clones were sequenced revealing the eight different VH genes (A-H) in a variety of pairings with seven different VK genes (a-g) (see AAR21264-92). Nearly all the VH genes belonged to gp 1, with only cone, "E", being of gp 2 (VHOx1). Of the twenty three clones sequenced, only one was of type "E". Most of the clones were Vk-d combinations. The kd of VH-B/Vk-d for phox-GABA was 10 nM. Only two other combinations (of eleven tested) were found to have higher values. This suggests that phage bearing scFv fragments having weak affinities can be selected with antigen, probably due to the avidity of the multiple antibody heads on the phage.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ablating/killing aberrant prostate specific membrane antigen-expressing
                                                                                     mouse anti
                                                                               This sequence represents a heavy chain variable region from a mouse ant: Vascular Adhesion Protein-1 (VAP-1) antibody. This sequence is included in the specification for comparison with the antibody of the invention. The murine antibody sequences of the invention may be used in the production of a chimeric mouse-human anti-VAP-1 antibody. The nucleic acid molecules, polypeptides or antibodies are useful in treating VAP-1 mediated inflammatory disorders, such as rheumatoid arthritis, inflammatory bowel disease, autoimmune diseases or psoriasis. The chimeric VAP-1 antibody is further used for in vitro and in vivo diagnostic applications, including in vivo immunoscintigraphic imaging inflammation sites. The chimeric MAD's of the invention have improved kinetic properties compared to the corresponding murine antibodies.

The present invention describes a method (MI) for ablating or killing an aberrant prostate specific membrane antigen (PSMA) expressing cell (e.g. an epidermal and adermal cell). MI comprises contacting the cell, or a vascular endothelial cell). MI comprises contacting the cell, or a vascular endothelial cell proximate to the cell, with an antibody (or its antigen-binding fragment), which binds specifically to the extracellular domain of PSMA in an amount sufficient to ablate or kill the cell. The antihoflammatory and antialleristic, antiarthritic, dermatological, cytostatic, antiinflammatory and antialleristic activities, and can be used in vaccines. MI is useful for treating a skin disorder in a subject, by administering to the subject, an amount of an antibody which binds specifically to the extracellular domain of PSMA (the subject is a dministering to the subject, an amount of an antibody which binds specifically to the extracellular domain of PSMA (the subject is a dministeribly human and is having, or at risk of, a skin disorder.). The skin disorder is a dermal or an epidermal disorder, and is selected from psoriasis (preferably chronic stationary psoriasis, psoriasis contasis, and localised pustular psoriasis, psoriatic arthritis, exfoliative dermatities, pityriasis rubra plans, lichen nitidus, christionare dermatities, pityriasis rubra plans, lichen plans, lichen nitidus, inflammatory or neoplastic disorder of the epidermal or neglecancerous lesion. MI is also useful to treat or prevent disorders involving aberrant activity of PSMA and ABR44613 to ABR44613 to ABR44613 represent sequences used in the exemplification of the beaucerous and in the exemplification.

Pharmaceutical kits for use in the treatment of prostate cancer, com anti-human seminal plasma protein single-chain antibody/human carboxypeptidase fusion protein and a prodrug of methotrexate-alphapeptides

29pp; Chinese. 4 Fig Claim 3;

The invention relates to a pharmaceutical kit for antibody-directed enzyme prodrug therapy (ADEPT) to treat prostate cancer. The kit comprises several respective containers for holding anti-human seminal plasma protein single-chain antibody (ScFv)/human carboxypeptidase A (hCPA) fusion protein (ABP97414), a prodrug of methotrexate-alpha-peptide and a pharmaceutically-acceptable auxiliary for medication. The invention also encompasses the anti-human seminal plasma protein ScFv/hCPA fusion protein, and the nucleic acid encoding it (ABZ75116). This was constructed by linking DNA encoding the ScFv (itself generated by linking DNA encoding the heavy and light chain variable regions (VH and VL) of the murine anti-human seminal plasma protein monoclonal antibody E4B7) to DNAs encoding human carboxypeptidase A via a linker. The ScFv portion of the fusion protein enables it to be specifically targeted to prostate cancer cells, where the hCPA portion can then activate the prodrug which in turn has cytostatic activity towards the cancer cells. The invention permits the fusion protein to be easily produced in large quantities for use in ADEPT for prostate cancer treatment. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a multifunctional polypeptide comprising a domain with a binding site that specifically recognises an extracellular group of the NKG2D receptor complex and a second domain which functions as a receptor or ligand. The polypeptide and its associated polynucleotide are used for the preparation of a pharmaceutical composition for the treatment of cancer, infections and/or autoimmune conditions. The cancer may be a tumour of the head and neck, stomach, oesophagus, colon, liver, intrahepatic bile ducts, pancreas, lung, larynx, breast, ovary, uterus, cervix, prostate, kidney, testis, thyroid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; NKG2D; NKG2D receptor complex; cancer; infectious disease; tumour; autoimmune disease; head; neck; stomach; oesophagus; colon; liver; ovary; intrahepatic bile duct; pancreas; lung; larynx; breast; uterus; cervix; prostate; kidney; testis; thyroid; bladder; brain; melanoma; myeloma; Fv; sarcoma; leukaemia; lymphoma; virus; bacterium; fungus; protozoan; DAP10; helminth; cytostatic; antimicrobial; immunomodulatory; 11B2D10; 6H7E7; 8G7C10; 6E5A7; 11B2D10x4-7; 8G7C10x4-7; 6E5A7x4-7; P4-2; P4-3; P4-14; P5-15; P5-2; P5-3; P5-9; P5-10; P5-11; P5-23; 3B10xP4-3; 3B10xP4-14; P53 tetramerisation domain; 3B10xP5-2; 3B10xP5-23.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   specifically

oesophagus, colon, liver, intrahepatic bile ducts, pancreas, lung, larynx, breast, ovary, uterus, cervix, prostate, kidney, testis, thyroid, bladder or brain, or a melanoma, myeloma, sarcoma, leukaemia or lymphoma. The infectious diseases can be caused by viruses, bacteria, fungi, protozoa or helminths. The autoimmune diseases include multiple sclerosis, Grave's disease, ankylosing spondylitis, acute anterior

```
The present sequence represents the heavy chain variable region of murine monoclonal antibody 2C4. This antibody binds to human sialoadhesin factor -2 (SAF-2). The antibody is useful for treating or preventing allergic rhinitis, allergies, asthma, anemia, eczema or diseases such as lymphoma, leukemia or systemic mastocytosis in a mammal. It is also useful for detecting the presence of a cell, especially eosinophil in a sample, by detecting binding of the antibody to SAF-2. The antibody can be coupled to toxins, antiproliferative drugs or radionuclides to kill cells in areas of excessive SAF-2 expression
                                                                                                                                                                                                                                                                                                                                                                                                                                             ; allergic rhinitis;

The cDNA encoding these peptides was synthesised using forward primers annealing to the Ck gene and the JH segment, followed by assembly with linker primers, VH back primers based on the VH3 leader sequence and

a forward Ck primer nested in respect to the primer used for cDNA. The assembled product within the cells is then amplified with nested primers annealing to the 5' end of the VH gene and the 3' end of the Jk segment. In-cell PCR may be used to determine gene linkage analysis, particularly for the cloning of gene combinations that are polymorphic within a population of cells, such as the rearranged genes for Ig or TCR V regions. (Updated on 25-MAR-2003 to correct PN field.)

٦,
    The sequences given in AAR32840-43 show the mature heavy chain VH domains and the Vk light chain genes of the antiphenyloxazolone hybridomas NQ2/12.4 and NQ10/12.5 which have been linked via a linker peptide by incell PCR. The cDNA encoding these peptides was synthesised using forward primers annealing to the Ck gene and the JH segment, followed by assembly with linker primer of the Ck grimers based on the VH3 leader sequence and a forward Ck primer nested in respect to the primer used for cDNA. The assembled product within the cells is then amplified with nested primers annealing to the 5' end of the VH gene and the 3' end of the Jk segment. In-cell PCR may be used to determine gene linkage analysis, particularly for the cloning of gene combinations that are polymorphic within a population of cells, such as the rearranged genes for Ig or TCR V regions. (Updated on 25-MAR-2003 to correct PN field.)

The invention relates to an antibody-toxic group conjugate comprising an antibody that specifically recognises a molecule expressed only on activated T cells, and a toxic group. The T cell molecule is preferably human cytotoxic T lymphocyte associated antigen 4 (CTLA4). The antibody of the invention is a humanised anti-CTLA4 antibody comprising a sequence of 128 or 142 amino acids fully defined in the specification. The antibody-toxic group conjugate is useful for modulating the immune consistency immune ersponse to a graft, allergic response or an autoimmune disorder, immune response to a graft, allergic response or an immune response to a therapeutic protein. The antibody is also useful for T-cell typing, for isolating specific IL-creeptor-bearing cells or fragments of the receptor, for vaccine preparation, and for determining the effectiveness of an agent to downergulate CTLA4 activity. The present sequence is the heavy chain variable region of mouse antibody 26. It was used in the construction of the humanised anti-CTLA4 antibody of the invention
                                                                                                                                                                                                                                                                                                                                                             118

sequences. The MAD 1A7 and polypeptides can be used for eliciting an anti-GD2 immune response. The polypeptides can also be used for detecting or purifying anti-GD2 antibody. The products can be used for treating GD2 -associated diseases, e.g. melanoma, neuroblastoma, glioma, soft tissue carcinoma, and small cell carcinoma. They can be used for palliating the disease or for reducing the risk of recurrence. The present sequence represents the heavy chain variable region consensus sequence

                                                     The invention provides a monoclonal antibouy (rem., elicits an anti-GD2 (tumor-associated antigen) immunologica humans. MAb 1A7 has defined light and heavy chain variable sequences. The MAb 1A7 and polypeptides can be used for eli-GD2 immune response. The polypeptides can also be used for the fining anti-GD2 antibody. The products can be used for the inventage of the form of the second contages.

                                                                                                                                                                                                                                                                                              118
        The invention relates to the recurrence and/or development of a ganglioside GD2-associated tumour, e.g. melanoma, in an individual which is delayed by administration of an antibody comprising light and heavy chain variable region sequences of the anti-idiotype monoclonal antibody 1A7. The antibody is used for delaying recurrence and/or development of GD2-associated tumour, e.g. melanoma, neuroblastoma, glioma, sarcoma, or small cell lung cancer, in individual, and for treating individual with GD2-associated tumour. The present sequence is a unique peptide region from an antibody sequence resembling the anti-idiotype antibody 1A7 heavy

The invention relates to a monoclonal antibody 1A7 (an anti-idiotype antibody eliciting an anti-GD2 (ganglioside) response). Also included are an antibody producing cell deposited under ATCC Accession No. HB-11786 (or its progeny), a polynucleotide comprising a sequence encoding a comprises at least 5 consecutive amino acids from a variable region of comprises at least 5 consecutive amino acids from a variable region of consecutive nucleotides that is capable of forming a stable duplex with a polynucleotide encoding the light or heavy chain variable region of polynucleotide consisting of a variable region encoding sequence polynucleotide consisting of a variable region encoding sequence polynucleotide, a fusion polypeptide comprising 1A7, a humanised antibody comprising 5 consecutive amino acids from the 1A7 variable regions and a vaccine comprising the antibodies. The antibodies are useful for eliciting an immune response in an individual, and for treating a GD2-associated diseases is chosen from melanoma, neuroblastoma, goft tissue sarcoma, and small cell carcinoma. The individual has a clinically detectable tumour, and the method is for treating the GD2-associated diseases. 1A7 is and the method is for treating a tumour that was previously detected in the individual and individual at the contract of individual at the contract of the

The present sequence is the heavy chain variable region of the group 11f8 putative consensus anti-DNA monoclonal antibody (MAb), which has a high affinity for single stranded DNA, low or no affinity for double stranded DNA and specifically binds a DNA hairpin. The MAb can be used diagnose disorders associated with the pathological complexation of DNA, e.g. inflammatory glomerulonephritis and systemic lupus erythematosus. It can also be used to generate reagents to screen for pharmaceutical agents, and treat and/or prevent an above disorder. The sequence was derived by aligning homologous anti-DNA MAb, whose sequences have been published, as well as several MAb of other specificities obtained from a database
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         NSALMSRLSISKDNSKSQVFLKMNSLQTDDTAMYYCARDRS-TMITAYAMDYWGQGTTVT

Patent No. 5830663

GENERAL INFORMATION:

APPLICANT: EMBLETON, Michael J.

APPLICANT: GORGCHOV, GUY

APPLICANT: JONES, Peter T.

APPLICANT: WINTER, Gregory P.

TITLE OF INVENTION: TREATMENT OF CELL POPULATIONS

NUMBER OF SEQUENCES: 70

CORRESPONDENCE ADDRESS:

ADDRESSEE: PILLSBURY MADISON & SUTRO, L.L.P.

STREET: 1100 New York Avenue, N.W.

CITY: Washington

STATE: D.C.

COMPUTER: D.C.

COMPUTER: BM PC compatible

COMPUTER: IBM PC compatible

COMPUTER: IBM PC compatible

OPERATING SYSTEM:

MEDIUM TYPE: Flopy disk

COMPUTER: Microsoft Word

CURRENT APPLICATION DATA:

APPLICATION NUMBER: US/08/190,199A

Sequence 16, Application US/08752844

Patent No. 5935821

GENERAL INFORMATION:

APPLICANT: Chatterjee, Malaya

APPLICANT: Chatterjee, MonocLonal Antibody 1A7 AND USE FOR THE

TITLE OF INVENTION: TREATMENT OF MELANOMA AND SMALL CELL CARCINOMA

TITLE OF INVENTION: TREATMENT OF MELANOMA AND SMALL CELL CARCINOMA

NUMBER OF SEQUENCES: 66

CORRESPONDENCE ADDRESS:

ADDRESSEE: MORRISON & FOERSTER

Sequence 9, Application US/09171945
Batent No. 6277599
GENERAL INFORMATION:
APPLICANT: Emery, Stephen
APPLICANT: Copley, Clive Graham
APPLICANT: Edge, Michael Derek
TITLE OF INVENTION: Monoclonal Antibody to CEA, Conjugates Comprising Said
TITLE OF INVENTION: Antibody, and Their Therapeutic Use in an Adept System
FILE REFERENCE: Monoclonal Antibody to CEA
CURRENT APPLICATION NUMBER: US/09/171,945
CURRENT FILING DATE: 1998-10-29
PRIOR APPLICATION NUMBER: GB9703103.3
